

Agentic Marketing Solution for Sentio

Executive Summary

This agentic marketing solution fixes two high-value pipeline leaks for Sentio, a churn prediction company: inbound demo requests are prioritized immediately, and the website chatbot becomes a qualified booking motion instead of a passive greeter.

The solution turns every hand-raise into a scored lead brief in HubSpot. High-fit leads get routed to sales with a research-backed "why now" signal and a draft email. Poor-fit leads are not ignored; they are moved to a disqualified stage with the reason recorded, so Marketing and Sales can audit the funnel instead of losing context.

Why This Matters to the CMO

The system is designed around pipeline outcomes, not automation for its own sake.

CMO problem	What the solution does for Sentio	Business value
Demo requests sit in a queue	Scores and routes every inbound lead at submission time	SDRs call the best leads first
Chatbot does not qualify	Sage answers product questions, qualifies visitors, captures email, and triggers handoff	Website traffic converts into qualified conversations
SDR outreach is generic	Qualified leads receive a sourced research signal and persona-specific draft email	Faster follow-up with stronger relevance
Disqualified leads disappear	Leads classified as low intent and chat-disqualified leads with email are captured, are written to HubSpot with reasons	So quality becomes auditable

Assumptions

Sentio is the B2B SaaS company in this assignment context. It helps SaaS teams predict churn and maintain real-time customer health scores.

Target ICP:

- B2B SaaS companies.
- Roughly 100 to 800 employees, with best fit around mid-market CS teams.
- Buyers include VP/Head of Customer Success, RevOps, CFO/CRO, and technical evaluators.
- Pain points include surprise churn, inconsistent playbooks, poor customer health visibility, and CSM capacity pressure.

What Was Built

1. Inbound Demo Prioritization

When a visitor submits the demo form, the backend:

1. Validates that a work email exists.
2. Enriches the person and company through Apollo.
3. Scores ICP fit and intent with deterministic code.

4. Routes the lead:
 - Grade A/B fit: continue to research, email generation, and HubSpot demo-requested stage.
 - C fit: skip AI research/email spend and create a disqualified HubSpot deal with the reason.
 - B fit above the headcount sweet spot: route as edge fit for SDR review.
5. Generates a lead brief for the website and a HubSpot note for Sales.

2. Sage Website Chatbot

Sage is the website assistant. It is page-aware, grounded in Sentio's knowledge base, and designed to move from answer to qualification without feeling like a form.

Sage:

1. Answers product, pricing, implementation, integration, and security questions from the knowledge base.
2. Asks one qualifying question at a time.
3. Classifies the conversation into continue, book, escalate, nurture, or disqualify.
4. Captures prospect email before any sales handoff.
5. On a booked chat lead, runs the same enrich -> score -> research -> CRM pipeline as the demo form.
6. On escalation, or disqualification where an email is available, creates the right HubSpot handoff note with transcript context.

Decision Logic

Lead Scoring

The ICP fit score is deterministic and calculated from scoring tables in `backend/app/scoring/data/` . The maximum fit score is 95 points.

Dimension	Parameter	Points
Headcount	51-99 employees	10
Headcount	100-300 employees	25
Headcount	301-800 employees	20
Headcount	801-2,000 employees	5
Headcount	2,001+ employees	0
Industry	Computer Software	20
Industry	Internet	18
Industry	Information Technology and Services	15
Industry	Financial Services with SaaS/API/platform signal	15
Industry	Human Resources	12
Industry	Marketing and Advertising	12
Industry	Telecommunications or E-learning	5
Industry	Financial Services without SaaS signal	5

Title	VP/Head of Customer Success	20
Title	Director of Customer Success	18
Title	CS Ops / Customer Success Operations	17
Title	CRO / Chief Revenue Officer	15
Title	CFO / VP Finance	12
Title	RevOps leadership	12
Title	Customer Success Manager / CS lead	8
Title	Senior CSM, AE, SDR, or similar end-user title	3
Title	CTO / VP Engineering / Head of IT	0
Title	CEO / Founder	0
Geography	United States	15
Geography	Canada or United Kingdom	12
Geography	Australia or New Zealand	10
Geography	Germany, France, Netherlands, Ireland, Spain, Italy, Sweden, Belgium, Austria, Switzerland, Denmark, Finland, Norway, or Portugal	7
Business model	B2B signal present	10
Business model	SaaS signal present	5

Grades:

- A: 60+ points. Strong fit, prioritized for Sales.
- B: 30-59 points. Workable fit, routed to Sales or marked edge-fit if above the 800-employee sweet spot.
- C: below 30 points. Disqualified, but still recorded with reason.

Chat Outcomes

Sage, the chatbot, evaluates self-reported signals during the conversation:

Signal	Why it matters
Use case or pain	Determines whether the visitor has a real churn/CS problem
Team context	Confirms relevance to CS, retention, or revenue operations
Authority	Identifies champion or decision-maker strength
Timeline	Separates active evaluation from casual browsing
Company scale	Prevents booking poor-fit companies

Outcomes:

- Book: strong fit, active pain, right authority, reasonable scale, and email captured.
- Escalate: custom enterprise pricing, security/procurement/legal review, implementation complexity, explicit human request, or weak knowledge-base confidence.
- Nurture: relevant but early-stage or not ready to buy.
- Disqualify: clearly outside market, such as pre-revenue, no CS function, or very small company. A CRM record is created when an email is available.
- Continue: answer the question and ask the next qualifier.

Deterministic vs Probabilistic

System part	Type	Reason
Email validation	Deterministic	Code checks for required email format before pipeline starts
Apollo cache lookup	Deterministic	Same domain/email returns same cached enrichment
ICP scoring	Deterministic	CSV-weighted rules calculate the score
Grade thresholds	Deterministic	Fixed A/B/C thresholds decide route
C-grade exit gate	Deterministic	C leads never reach research or copywriting
HubSpot stage mapping	Deterministic	Route maps to a fixed CRM stage
Deal/contact dedupe	Deterministic	CRM upsert is keyed by email/deal identity
Knowledge retrieval	Probabilistic support step	Vector search ranks likely relevant KB chunks
Sage answer generation	Probabilistic	LLM writes natural-language answers, constrained to retrieved KB
Chat outcome classification	Probabilistic with deterministic guardrails	LLM interprets conversation signals; code controls email capture and final CRM action
Research signal selection	Probabilistic with source constraints	LLM summarizes the strongest "why now" signal from Apollo/Tavily inputs
Email draft	Probabilistic with source constraints	LLM writes copy from sourced facts and persona framing

The most important business decision, who gets prioritized, is deterministic. The probabilistic parts improve explanation, personalization, and conversation quality, but they do not own the scoring math.

Agent Architecture

Agent	Job	Guardrail
Research Agent	Finds the strongest sourced "why now" signal	Must use Apollo/Tavily inputs and return a source or no signal
Copywriter Agent	Writes persona-specific SDR email and handoff notes	Cannot invent facts, stats, funding, pricing, or tech stack

CRM Agent	Upserts contact/deal and attaches notes	Every deal must have a note; disqualified deals require a reason
Sage	Answers and qualifies website visitors	Answers only from the KB; redirects/escalates when confidence is low

Funnel Flow

Demo form

- > validate email
- > Apollo cache/enrichment
- > deterministic ICP + intent score
- > route
 - > A/B or edge fit: research -> email -> HubSpot demo-requested
 - > C fit: HubSpot disqualified with reason

Website chat

- > answer from knowledge base
- > ask one qualifier at a time
- > classify outcome
 - > book: capture email -> inbound pipeline -> HubSpot demo-requested
 - > escalate: capture email -> HubSpot handoff note
 - > nurture: offer relevant resource
 - > disqualify: warm close, record reason when email is available

Trade-Offs

Built now:

- Inbound scoring and routing.
- Research-backed sales handoff.
- Persona-specific email draft.
- Sage chatbot with qualification and booking flow.
- HubSpot upsert and dedupe.

Deferred:

- Full outbound list personalization workflow.
- Real meeting-calendar slot booking. Current implementation creates a sales handoff/demo-requested deal rather than selecting a calendar time in-chat.

Success Metrics

The CMO should evaluate the solution on:

- Speed-to-lead for grades A/B inbound requests.
- Percentage of website chats that become qualified handoffs.
- SDR acceptance rate of agent-generated lead briefs.
- Demo-requested to meeting-booked conversion.
- Disqualified lead audit accuracy.
- Reduction in low-fit SDR follow-up.
